Abstract

The acceptance of Egyptian universities depend on the total scores in secondary school .This system has many defects as followed:

Firstly: Courses which student learned have no relation to the college which the student desire to join.

Secondly, these grades of ineligible courses are the corner stone in the system of acceptance in college.

Thirdly: There is no relationship between the number of students acceptance to the college and the number of Job vacancies

Thus, this paper presents a proposal that the acceptance of different colleges depend on eligible courses, the availability of number of jobs for each segmentation, and capacity degree of college , The wishes of students .So, the proposal of information system works to rationalize the college admissions, which is beneficial to both the state and the student.
